UGV

Madhur, Nikhil, Umesh

November 2026

1 Day 1

We assembled the UGV with the instructions from the repo. We ran a dummy code to test the working of the motors and hardware. We noticed one of the motors was not spinning, so we disassembled and reassembled the circuit and the 2 motors started working.

2 Day 2

We uploaded a code and it initially overheated. Then we firmly connected the joints again and it didn't overheat. We initially thought about using potentiometer or voltage regulator for power supply but decided to use an arduino uno as it was already present.
